

Proof of Concept Testing

The most reliable way to evaluate what BEE International's technology can provide your project is to conduct testing with our equipment. During this process we will custom tailor the mixing cell to your application before achieving target results.

Product Testing

At BEE International Testing Facilities

Once we receive a sample of your product, we experiment with different mixing configurations to achieve the best possible results. We can send you the particle size analysis report as well as the samples themselves, if needed.

On-Site Demonstration

At Your Facilities

A representative from BEE International will bring a system to your facility for training and experimentation. This option enables many members of the team to learn more about the technology by seeing firsthand how simple it is to operate, how versatile it is in a wide range of applications, and the industry leading results it can achieve.

Trial Program

At Your Facilities

Our trial programs enable you to conduct extensive experiments on a monthly trial period. This is an outstanding option for customers with multiple applications. If a purchase is made, this becomes a cost free method of experimentation
